

# Sprockets

# BASICS ON SPROCKETS

Sprockets consist of mechanical teathed rotating elements which coupled with a roller chain are used to change speed, torque or direction of a motor shaft. Chains and sprockets have to be compatible,

that is have to have the same thickness and pitch and work on parallel shafts, that is, with the teeth in the same plane.

## Basic features of a sprocket

The most common are marked in dots in the figure below.

**Detail:**

### Number of teeth

The total count of teeth is a basic feature. The use of sprockets with a small number of teeth cause bigger shock and thus more wear on the sprocket and on the chain due to the higher rotation of the bush in the pin and higher wear than in big sprockets.

### Pitch diameter

The diameter of an imaginary circle described by the center of the chain pins.

The pitch diameter is related to the pitch by this math formula:

$$\text{Pitch diameter} = \text{Pitch} / (\sin 180/Z) \text{ being } Z \text{ the teeth number}$$

The table relates the number of teeth (Z) of the sprockets with the primitive diameter.

### Pitch

Consider the chain pitch as defined like the distance between the centers of two consecutive pins, i.e. the pins' center lines in a chain link. Represented as well in inches per tooth. As example a pitch of 0,25" is represented by # 25 and one of 0,375" is represented by # 35.

### Bottom diameter

The diameter of the imaginary circle described by the bottom point of the tooth gaps. In a pair-toothed sprocket it can be precisely measured.

### Caliper diameter

The distance between the bottom of one tooth gap to the bottom of the nearest opposite tooth in an odd-toothed sprocket. In a pair-toothed sprocket the bottom and caliper diameters are equal.

## Primitive diameter vs number of teeth

The primitive diameter (PD) is related to the pitch (P) and number of teeth (Z) by the math formula above  $PD = P / (\sin(180/Z))$ , whereas  $1 / (\sin(180/Z))$  is the factor K.

The primitive diameter is obtained multiplying the factor K by the pitch corresponding to any number of teeth.

**Example:** One sprocket # 35 of 36 teeth has a Primitive Diameter of 4,3026" result obtained by multiplying the pitch of 3/8" or 0,375 by the factor K corresponding to 36 teeth 11,4737.

## Outside diameter

The diameter of the circle described by the tip of the teeth. This diameter is always smaller than the chain clearance diameter as does not take into account the portion of the chain added.

## Hub

The ANSI B29.1 Standard describes the classification of the sprockets by the hub shape, namely the types A, B, C, D.

**Type A.** Flat structure with no hub. This type has to be mounted on a flange or hub or any other device.

**Type B.** Flat structure with hub on one side. This type is usually used on small and intermediate size sprockets.

## Hub diameter

The diameter across the hub which cannot exceed the clearance distance of the chain wrapped-around articulation.

## Maximum bore

The largest diameter of the bore leaving a hub wall thickness enough to stand up the application's torque. Allowance for keyway and set screws must be taken into consideration.

## Length through bore. LTB

The length of the bore through the sprocket. It has to be long enough to accommodate the key to withstand the torque of the application while ensuring the stability of the sprocket on the shaft.

## Face width

The maximum width of the sprocket is constraint to allow clearance so that the chain to engage and disengage. The minimum width is constraint to the provision of enough strength needed by the application.

## Chordal effect

Known as well as the polygonal effect in chain drives. The chain passes around the sprocket as a series of chordal links causing a speed variation during the rotation through the speed angle affecting the wear. The more teeth a sprocket has the closer the chords are to a circle minimizing the chordal effect.

Consequently, the use of larger sprockets makes the rotation smoother. For smooth operation at moderate to high speeds, a driving sprocket of at least 17 teeth is a good practice. Higher than that gives better life expectancy and less noise. This combined with an odd number of chain links for uniform wear and tear on teeth and rollers produces a better result in terms of product life.

At the point A in the left figure, the chain has the maximum speed given the fact it is the result of multiplying the angular speed by the radii, that is  $V_{max} = \pi d n$ . When the point A of the chain link arrives at point B, right figure, the speed is  $V_{min} = \pi d n \cos(\alpha/2)$ , thus the change in speed is  $V_{max} - V_{min} = \pi d n [1 - \cos(\alpha/2)]$ . The result is that the speed is not uniform provoking a shaking movement, which is what the chordal effect is about. The chordal effect decreases to the extent the number of teeth increases.

## Chain clearance diameter

The diameter of an imaginary circle described by the tip of the chain wrapping the sprocket. This diameter will always be greater than the outside diameter and it is very useful when checking distances of the sprockets to potential obstacles.

**Type C.** Flat structure with hubs on both sides. Hubs are centered. Usually used in large size sprockets.

**Type C Offset.** Hubs in both sides off center. This type is a variation of the Type C above.

**Type D.** Hub attached to a plate by a detachable bolt.

## Minimum Plain Bore (MPB)

Plain bores, often referred to as minimum plain bores or MPB, are simply untapered bores drilled through the center of a pulley, gear, sprocket, or sheave. In our Reference numbers we use MPB to designate the plain bore style. Finished bores are plain bores with the addition of either a keyway, set screws, or both. An F in the Reference part number illustrates a finished bore. A keyway is a slot cut into a pulley, gear, sprocket, or sheave to accept a key that engages with a similar slot on a shaft to block the relative motion of the two components. Keys connecting shafts to sprocket hubs are commonly used to achieve reliable no-slip power transmission in belt drive systems. A set screw is a screw through the sprocket hub to keyway tightening the key into the keyseat and thus limiting slippage. Typically, set screws are used on larger diameter components as they normally transmit higher loads. There are some advantages to having a plain bore. With a plain bore, it is easier to customize how the component is fixed to the shaft. A plain bore can be opened to a larger bore diameter, can be made into a finished bore, or can even be customized in other ways such as incorporating pins or screws. There are also advantages to having a finished bore, the most noteworthy advantage is the increased prevention of shaft slippage. It allows for the component to move larger loads with increased accuracy. A noteworthy disadvantage is in the food and beverage industry where set screw holes will at times fill with debris depending on the application.

Composing the speed variation ratio with the number of teeth, the result shows that the bigger the number of teeth the less is the ratio of the speed variation.

# SPROCKET STANDARDS

## Sprocket and Roller Chain Standards

The ISO Standard is mainly used in Europe. The British Standard, BS is equivalent to the ISO 606 B. The sprockets under this standard require chains of ISO / BS. Although they resemble to the ANSI they are thick and in general do not match.

In general, the ANSI Standard B.29.1 for Sprocket/Chain is mainly used in North America and Asia.

JIS Standards are mostly used in Japan under JIS standards B 1801, B 1802 and B 1803.

DIN Standards are very similar to the BS an ANSI Standards under the codes 8187 and 8188.

SPROCKET & CHAIN CATEGORY / STANDARD	ANSI	ISO/BS	JIS
Power transmission sprocket	B29.1M	606	B 1802
Power transmission roller chain	B29.1M	606	B 1801
Power transmission bushed chain	B29.1M	1395	B 1801
Heavy duty chain	B29.1M	3512	
Leaf chain	B29.8M	4347	B 1804
Double pitch conveyor and chain sprocket	B 29.4	1275	B 1803
Conveyor chain	B 29.15	1977/1-3	JCAS 2

## A. ANSI Standard Sprockets

Number of Sprocket with a minimum of two digits and a maximum of three. Starts with 25 up to 240. ANSI has eight different strand types, namely single, double, triple and multiple, that is 4, 5, 6, 8 and 10. They are measured in eighths of an inch.

Type of Sprocket. A to D plus inter-versions. Maximum of two digits.

Number of strands. One only digit. 1 for one strand and further up to 4.

Number of teeth. A maximum of three digits for 100 or more teeth.

Taper Bush. Two alpha numbers describing the Taper Bush type, either TB for Taper Lock®, QD® for Quick Detach, ST® for Split Taper, XT® for Extra Taper.

Material. Two alpha numbers to describe the material and surface plating if any. SS for Stainless Steel, BR for Brass. BZ for bronze. Cd for Cadmium plate, Ni for Nickel, Zi for Zinc, Cr for Chrome, OM for other material. No reference describes Steel as material.

Heat Treatment. Two alpha numbers to be described HT Hardened Teeth, CH Case Hardened or NT for No Treatment.

Bore. Two alpha numbers describing, PB for Minimum Plain Bore, FB for Finished Bore. A finish bore means a bore with a keyway and two setscrews.

PB for Plain Bore is usually referred to as Minimum Plain Bore, MPB, which are simply untampered bores drilled through the center of the sprocket, gear or pulley given the case.

Minimum Plain Bore has advantages as the element can be customized, converting it to a Finished Bore and inserting set screws.

FB for Finished Bore are bores with the addition of a keyway and eventually by Set Screws, referred usually as SS. The set screws are used to tight the component, in this case a sprocket to the shaft and the key to the key, thus limiting the slippage and backlash. Usually, set screws are used on larger elements which may transmit higher loads.

**Example:** 35 C 2 19 TB HT PB 1 1/2"

This is an ANSI-type sprocket with a 3/8" pitch Rollerless chain, Symmetrical Double hub, two strands, 19 teeth, Taper Bush, Teeth hardened, Minimum Plain bore of 1 1/2".

## B. ISO Standard Sprockets

The ISO Roller Chain Sprockets are designed to engage British Standard Chains in conformity to the ISO 606 Standard, and are not interchangeable with the ANSI Sprockets. The former is mainly used in Europe and Africa, they are measured in sixteenths of an inch although expressed in metric units. The ISO Standard includes, single, double and triple strand sprockets.

The outer plates of the ISO roller chain are above the application needs, resulting in a heavier and bulkier chain with longer life.

The letter B is a fix part of the reference which indicates the European Standard and starts with 06B for a pitch of 3/8" and continues with 08B, 10B, 12B, 16B, 20B, 24B and 32B with a 2" pitch.

The ISO sprockets Metric bore sizes are described with the alpha number MM and Two digits for the diameter.

**Example:** 20 B-3 indicates an ISO Sprocket of 1 11/4" pitch, three strands

### \*Hardened Teeth

Case hardening the teeth of the sprockets usually by induction, provides at their wearing areas a hard layer which contributes to the reduction of wear as well as absorbs shock loads, while maintains the ductility of the core.

Although the general guide of chain technique advises to harden the teeth in sprockets less than 25 teeth due to the fact that the load in teeth increases as the number of teeth decreases, the sprockets of our program are hundred percent hardened teeth.

Delivered with two Setscrews disposed at 90°.  
Keyway is cut at the tooth centerline.

Bore to size in inches or mm.  
Screw drawn to keyway center.

Delivered with two Setscrews disposed at 90°.  
Keyway is cut at the tooth centerline.

Bore to size in inches or mm.  
Screw drawn to keyway center.

# NO 80 1" PITCH STAINLESS STEEL

Delivered with two Setscrews disposed at 90°.  
Keyway is cut at the tooth centerline.

Bore to size in inches or mm.  
Screw drawn to keyway center.

# NO 100 1 1/4" PITCH TYPE STAINLESS STEEL

# IC. IDLE SPROCKETS

## Basics

Idle sprockets are very useful elements to maintain the tension in a chain drive system. It consists of a sprocket mounted on an arm, which pulls the sprocket against the chain and keeps the chain tightened. A larger sprocket is indicated as normally will last longer time as the speed is lower.

Aside of providing constant tension it helps to guide the chain, provi-

des bigger wrap of the chain in small sprockets, absorbs slack produced by wear, helps to smooth the transmission with uneven loads and as a plus may provide a reverse rotation in case the sprocket is mounted on the outside of the chain.

Our program comprehends a range of bronze-friction bush and ball bearing referred as BZ and BB respectively in the reference number.

Other available versions of Idlers: Nylon material idlers. Needle bearing idlers. Metric versions available.

# ID. DOUBLE PITCH SPROCKETS

## Basics

Used with conveyor chain systems where, broadly speaking, chains operate in longer distances and at lower speeds than transmission chains, they are different from sprocket of single pitch chains.

This type of sprockets are engaged with series 2000 roller chain, which have standard-size rollers having the same roller diameter and width as the ANSI B29.1 Roller Chain Standard of half the pitch. Their pitch is doubled, thus reducing the number of sprocket teeth engaged to half, and by every turn of the sprocket only half of the sprocket's teeth make a function with the result that any tooth of an odd-number sprocket will be engaged on every other turn what means a longer sprocket life.

These sprockets known as Hunting Tooth and Double Duty as well as they extend the useful life of the sprocket twice that of regular sprockets.

By manually advancing one tooth in an even number of teeth, the sprocket life will be as well longer, hence the name known as Double Duty after that effect. These sprockets have the same outside diameter and width as the single-pitch equivalent but have a slightly different profile, which confers a better seating of the chain. In fact, the Double Pitch Roller Chain series 2000 does not seat correctly in a Single Pitch Sprocket as they engage in position higher on the sprocket tooth face what creates stress in both, the chain and to the teeth of sprocket, increasing the wear, vibration, eventually jumping the chain and at the end damaging the unit. The bigger the sprocket the less this effect will be, to the extent that the ANSI Standard sprockets of 30 teeth and above may be used.

These sprockets are labelled as Standard while the chain as Standard Roller Conveyor type.

The reference number of the chain and consequently of the sprocket is formed after adding the number 2000 to the sprocket matching a 2000 chain number and adding the number 2002 to the sprocket matching a 2002 chain number. The chains use the prefix C for Conveyor and an H as a suffix indicating a Heavy style link plates.

The 2002 roller chain series are the same than the 2000 except for the size of the rollers which are larger and protrude above and below the link plates producing a rolling action and that the teeth are cut to engage the roller chain. The sprockets engaged by this chain series are known as Carrier Rollers.

The sprockets for the C-2002 series chain with bigger rollers are cut to engage the chain of same roller diameter, while the sprockets of series C-2000 can not engage Double-pitch chain with Carrier Rollers.

Thus an ANSI 60 sprocket will be referred as a C2060 which will indicate to be 1 1/2" Double Pitch Standard Roller Sprocket engaging a Standard Roller Double Pitch Conveyor Chain or C2060H when engaging a Heavy chain. Alternatively will be referred as C2062 1 1/2" Double Pitch Carrier Roller Sprocket engaging a Double Pitch Big Roller Conveyor Chain or C2052H if engaging a Heavy chain.

Double Pitch sprockets are cut special for use with Double Pitch chain, and eventually a regular ANSI standard sprocket with 30 teeth and above may be used.

Standard Roller

Carrier Roller

# IE. DOUBLE SINGLE SPROCKETS

## Basics

These sprockets are used to run two single-strand type roller chains, hence the name double-single comes from, thus can run two chains with one only shaft for both.

The sprockets are built with two plates with a certain distance between them in a way that each strand is connected to a different chain, which can drive in different directions.

These sprockets are usually type A although in our program, which starts with ANSI #40 up to, #160 are compatible with Taper Bush and Split Taper Bush.

## Ansi & Metric

In ANSI standard we start with the No 40, 1/2" pitch up to No 160, 2" pitch receiving either MPB, Taper bush or Split taper while in ME-

TRIC we cover from 06B, 3/8" pitch up to 16B, 1" either MPB or Taper bush type.

# IF. CASTING SPROCKETS

## Basics

Iron Casting Sprockets are made out under the standard DIN EN 1561 which specifies the properties and grades of the casting alloy of iron and carbon. The grade used in our iron casting sprockets is the EN-GJL-200 which designation supercedes the grade used previously by DIN 1691, GG20<sup>1</sup>.

The properties of this casting are very appropriate for big size sprockets. Our program starts with 37 teeth up to 114, in two versions, the MPB, that is the Minimum Plain Bore which can be easily customized according to the shaft to be fit to and the Taper Bush which measurements and other details are displayed in the tables ahead.

## IF1. SPROCKETS MPB

# IG. ROLLER CONVEYOR CHAIN SPROCKETS

Made under the Standards DIN 8165 versions 1, 2 and 3, 8166 and 8167 describing Solid bearing pin type FV\* conveyor chains and related sprockets, establishing the specific parameters for materials and construction.

We have an ample program of A, B and C type sprockets in both Metric and Imperial.

In the tables ahead we display the most basic types, that is, Metric A type sprockets with pitches of up to 250 mm in C type sprockets.

We can supply this range in inches type A plates and type C with pitches of 1,654 (1 2/3) inches to 9 inches pitch.

## Metric

Type C

# IH. FLAT TOP CHAIN SPROCKETS

Made according the Standards DIN 8153-ISO 4348 latest edition which establish the characteristics of flat-top chains and associated chain wheels as used basically on conveyors in the packaging and food industry and in particular for bottling, interchangeability, measuring loads and minimum ultimate tensile loads.

We offer the series 800, namely 815, 820, 821, 822, 880 and 881 in versions solid and split and, as far as materials, Thermoplastic, Cast Iron and semi steel.

The version of split sprockets stand out for their convenience as there is no need to take off the sprocket from the shaft what makes maintenance faster and more efficient as no other part of the transmission is affected. Another factor to be taken into account in favor of thermoplastic is the lower strength the teeth have to stand when compared with the strength a driving chain sprocket has to resist due to their wider width.

It is recommended to use sprockets with odd number of teeth as they reduce wear given the fact that any particular tooth engages the chain every alternate turn while a sprocket with an even number of teeth, any particular tooth will engage the same roller on each turn. In this case, by advancing systematically one tooth the wear will be more even.

## Series 815

### Series 815. Thermoplastic. Solid

REFERENCE*	TEETH NO**	PITCH DIA $\Phi_p$	OUTER DIA $\Phi_o$	BORE SIZES $\Phi_b$	WEIGHT KG/LBS

TL-CC600-14	14	285,50	296,40	95,00	50,80	8,74

\* All measure in mm unless otherwise indicated.

Idler

Alternative Casting CC600  
Driving Sprocket KTH Profile

Choices available: Blind Hub, RSB Raw Stock Bore, MPB Minimum Plain Bore, MTS Made to Size with Keyway for Set Screws.

See page number H109, for the mating chain.

## For round chains

To be used for Bucket elevators and made under the Standard DIN 764,766 and 22252.

For information, please contact our commercial service.

Idler

## For detachable chains
